# 1. Introduction

This specification presents design guidelines for software engineers that use FSC-BT6XX series modules for Bluetooth requirements.

## 1.1 Terms

Throughout this specification:

- {} : Content between {...} is optional
- << : Content behind << represents a *COMMAND* sent from Host to Module
- >> : Content behind >> represents a *RESPONSE* sent from Module to Host

## 1.2 Hardware Interface

- GPIO
- PWM
- UART
- SPI Master/Slave
- I2C Master/Slave
- Analog Input/Output

## 1.3 Supported Bluetooth Profile

- GATT Server (Generic Attribute Profile)
- GATT Client (Generic Attribute Profile)
- HID Keyboard (Human Interface Profile)

## 1.4 Command Format

*AT+ Command {=Param1{, Param2{, Param3...}}}* <CR><LF>

- All commands start with "AT", end with <CR><LF>
- <CR> stands for "carriage return", corresponding hex is 0x0D
- <LF> stands for "line feed", corresponding hex is 0x0A
- If command has parameter, parameter keep behind "="
- If command has multiple parameters, parameter must be separated by ","
- If command has response, response start with <CR><LF>, end with <CR><LF>
- Module will always report command's execution result using "OK" for success or "ERROR" for failure

e.g.

1. Read module's BR/EDR local name  
    << AT+NAME  
    >> +NAME=Feasycom  
    >> OK
2. Write a baudrate which is not supported  
    << AT+BAUD=0  
    >> ERROR

## 1.5 Indication Format

<CR><LF>+ Indication {=Param1{, Param2{, Param3...}}} <CR><LF>

- All indications start with <CR><LF>, end with <CR><LF>
- If indication has parameter, parameter keep behind “=”
- If indication has multiple parameters, parameter must be separated by “,”

e.g.

1. Received “1234567890” from mobile phone via GATT Server profile  
    >> +GATTDATA=10,1234567890

## 1.6 Module Default Settings

Local Name	Feasycom
Service-UUID	FFF0
Write-UUID	FFF2
Notify-UUID	FFF1
Physical UART Baudrate	115200bps/8/N/1

## 2. Command Table

### 2.1 General Commands

#### 2.1.1 UART Communication Test

<b>Format:</b> AT
<b>Response:</b> OK
<b>Description:</b> Test the UART communication between HOST and Module after power on, baudrate changed, etc.
<b>Example:</b> UART communication test << AT >> OK

#### 2.1.2 Read Firmware Version

<b>Format:</b> AT+VER
<b>Response:</b> +VER=Param Param: Firmware version (15 Bytes ASCII)
<b>Example:</b> Read module's firmware version << AT+VER >> +VER=1.0.1,FSC-BT630 >> OK

#### 2.1.3 Read MAC Address

<b>Format:</b> AT+ADDR
<b>Response:</b> +ADDR=Param Param: Module's LE MAC address (12 Bytes ASCII)

## 2.1.4 Read/Write Local Name

<p><b>Format:</b> AT+NAME {=Param1{, Param2}}</p> <p>Param1: BLE local name (1~29 Bytes ASCII, default: Feasycom)</p> <p>Param2: MAC address suffix (0/1, default: 0)</p> <p>(0) Disable suffix</p> <p>(1) Enable suffix “-XXXX” (lower 4 bytes of MAC address) after local name</p>
<p><b>Response:</b> +NAME=Param</p>
<p><b>Description:</b> Write local name if parameter existence, otherwise read current local name</p>
<p><b>Example:</b> Read current local name</p> <pre>&lt;&lt; AT+NAME &gt;&gt; +NAME=Feasycom &gt;&gt; OK</pre> <p><b>Example:</b> Change module's local name to “ABC”</p> <pre>&lt;&lt; AT+NAME=ABC &gt;&gt; OK</pre> <p><b>Example:</b> Change module's local name to “ABC” and enable suffix</p> <pre>&lt;&lt; AT+NAME=ABC,1 &gt;&gt; OK</pre>

## 2.1.5 Read/Write UART Baudrate

<p><b>Format:</b> AT+BAUD{=Param}</p> <p>Param: Baudrate (1200/2400/4800/9600/19200/38400/57600/115200/230400, default:115200)</p>
<p><b>Response:</b> +BAUD=Param</p>
<p><b>Description:</b> Module's baudrate will be changed immediately after received this command</p>

## 2.1.6 Turn On/Off Throughput Mode

<p><b>Format:</b> AT+TPMODE{=Param}</p>
---

<p>Param: Throughput mode (0/1, default:0) (0) Turn Off (1) Turn On</p>
<p><b>Response:</b> +TPMODE=Param</p>
<p><b>Description:</b> When GATT profile connected and throughput mode is on, the AT command will be de-active, every byte received via physical UART will be sent to air, vice visa</p>
<p><b>Example:</b> Read current throughput mode &lt;&lt; AT+TPMODE &gt;&gt; +TPMODE=1 &gt;&gt; OK</p> <p><b>Example:</b> Turn off throughput mode &lt;&lt; AT+TPMODE=0 &gt;&gt; OK</p>

### 2.1.7 Turn On/Off Low Power Mode

<p><b>Format:</b> AT+LPM{=Param} Param: Low Power Mode (0/1, default: 0) (0) Turn Off (1) Turn On</p>
<p><b>Response:</b> +LPM=Param</p>

### 2.1.8 Turn On/Off Hardware Flow Control

<p><b>Format:</b> AT+FLOWCTL{=Param} Param: Hardware Flow Control (0/1, default: 0) (0) Turn Off (1) Turn On</p>
<p><b>Response:</b> +FLOWCTL=Param</p>

## 2.1.9 Read/Write Master/Slave Mode

<p><b>Format:</b> AT+ROLE{=Param}</p> <p>Param: Master/Slave mode (0/1, default: 0)</p> <p>(0) Slave Mode(GATT Server)</p> <p>(1) Master Mode(GATT Client)</p>
<p><b>Response:</b> +ROLE=Param</p>
<p><b>Description:</b> After the command is executed, the BT6XX switches to the new Mode</p>
<p><b>Example:</b> Read current Master/Slave mode</p> <pre>&lt;&lt; AT+ROLE &gt;&gt; +ROLE=0 &gt;&gt; OK</pre>

## 2.1.10 PIO Function Configuration

<p><b>Format:</b> AT+PIOCFG{=Param1,Param2}</p> <p>Param1 0: Disable Command/Transmission mode switch function 1: Enable Command/Transmission mode switch function</p> <p>Param2 0: Disable Bluetooth disconnect function 1: Enable Bluetooth disconnect function</p>
<p><b>Response:</b> +PIOCFG=Param1,Param2</p>

## 2.1.11 Scan Nearby Devices

<p><b>Format:</b> AT+SCAN =Param1{, Param2{, Param3}}</p> <p>Param1: (0~3)</p> <p>(0) Stop scan</p> <p>(1) Scan nearby BLE devices</p> <p>Param2: (1~48) Scan period. unit:1.28s, default:12.8s</p> <p>Param3: (1~25 Bytes ASCII) Name filter. Filter scan results with name if set</p>
<p><b>Description:</b> Refer to Chapter 3 for format description of scan result</p>

## 2.1.12 Release All Connections

<b>Format:</b> AT+DISC
<b>Description:</b> Module release all Bluetooth connections with remote device

## 2.1.13 Soft Reboot

<b>Format:</b> AT+REBOOT
<b>Description:</b> Module release all Bluetooth connections with remote device then reboot

## 2.1.14 Restore Factory Settings

<b>Format:</b> AT+RESTORE
<b>Description:</b> Module restore all factory settings then reboot

## 2.1.15 Establish GATT Connection (GATT Client only)

<p><b>Format:</b> AT+LECCONN=Param1{Param2,Param3,Param4}</p> <p>Param1: MAC address of target device &amp; MAC address type (13 Bytes ASCII)</p> <p>Param2: Service-UUID, Support 16 Bit and 128 Bit (4 Bytes/32 Bytes ASCII)</p> <p>Param3: Write-UUID, Support 16 Bit and 128Bit (4 Bytes/32 Bytes ASCII)</p> <p>Param4: Notify-UUID, Support 16 Bit and 128Bit (4 Bytes/32 Bytes ASCII)</p>
<p><b>Description:</b> If parameter 2, parameter 3, parameter 4 do not exist, the module will automatically search for the GATT service connected to the remote device</p>
<p><b>Example:</b> Specified remote device service connections</p> <pre>&lt;&lt; AT+LECCONN=123456ABCDEF0,FFF0,FFF2,FFF1 &gt;&gt; OK</pre>

## 2.1.16 Send Data Via GATT

<p><b>Format:</b> AT+LESEND=Param1, Param2          Param1: Payload length (1~155)          Param2: Payload (1~155 Bytes UTF8)</p>
<p><b>Description:</b> If throughput mode is on, this command is de-active</p>
<p><b>Example:</b> Send data "1234567890" to remote device via GATT</p> <pre>&lt;&lt; AT+LESEND=10,1234567890 &gt;&gt; OK</pre>

# 3. Indication Table

## 3.1 General Indications

### 3.1.1 Scan Result

<p><b>Format:</b> +SCAN =Param1, Param2, Param3, Param4{, Param5, Param6}          Param1: Index (1~8)          Param2: Device address type (0~2)              (0)LE public address              (1)LE random address          Param3: MAC address (12 Bytes ASCII)          Param4: RSSI (-255 ~ 0)          Param5: Size of Param6 if exist          Param6: Remote Device Name</p>
<p><b>Description:</b> Param5/Param6 may not exist if remote device out of distance</p>
<p><b>Example:</b> Scan nearby BLE devices</p> <pre>&lt;&lt; AT+SCAN=1 &gt;&gt; OK +SCAN=1,0,DC0D30000003,-32,8,Feasycom +SCAN=2,1,DC0D30000044,-64,8,Feasycom_0044 +SCAN=3,0,DC0D30000097,-47,8,FSC_BT906</pre>

## 3.1.2 GATT Received Data

**Format:** +GATTDATA=Param1, Param2

Param1: Payload length

Param2: Payload

**Example:** Received data "1234567890" from remote device via GATT

<< +GATTDATA=10,1234567890

## 3.2 GPIO Indications

### 3.2.1 LED Pin

#### **PIN32 (Output)**

Low Level      Initializing

Blink in 1Hz    Ready to connecting

High Level      Connected

### 3.2.2 State Pin

#### **PIN33 (Output)**

Low Level      Disconnected

High Level      Connected
